Index of Appendices for the Summary of
Survey Response Patterns Counties A – M:

B.1 - Beaver County	2-89
B.2 - Box Elder County	90-191
B.3 - Cache County	192-295
B.4 - Carbon County	296-395
B.5 - Daggett County	396-489
B.6 - Davis County	490-592
B.7 - Duchesne County	593-689
B.8 - Emery County	690-788
B.9 - Garfield County	789-885
B.10 - Grand County	886-984
B.11 - Iron County	985-1089
B.12 - Juab County	1090-1187
B.13 - Kane County	1188-1282
B.14 - Millard County	1283-1383
B.15 - Morgan County	1384-1482

Appendix B.1

Summary of Survey Response Patterns for Beaver County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.1) focuses on survey results obtained for Beaver County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 173 residential household mailing addresses in Beaver County. Of these, 110 survey packages were returned as undeliverable, resulting in an adjusted sample size of 63 households. Completed questionnaires were returned from 24 of those households, representing a survey response rate of 38.1%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Beaver

Q1.1 Recreational activities: camping

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	18	75.0	75.0	75.0
	No	6	25.0	25.0	100.0
	Total	24	100.0	100.0	

Q1.2 Recreational activities: picnicking

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Yes	18	75.0	75.0	75.0
	No	6	25.0	25.0	100.0

Appendix B.2

Summary of Survey Response Patterns for Box Elder County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.2) focuses on survey results obtained for Box Elder County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Box Elder County. Of these, 35 survey packages were returned as undeliverable, resulting in an adjusted sample size of 318 households. Completed questionnaires were returned from 150 of those households, representing a survey response rate of 47.2%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.3

Summary of Survey Response Patterns for Cache County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.3) focuses on survey results obtained for Cache County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 588 residential household mailing addresses in Cache County. Of these, 94 survey packages were returned as undeliverable, resulting in an adjusted sample size of 494 households. Completed questionnaires were returned from 251 of those households, representing a survey response rate of 50.8%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.4

Summary of Survey Response Patterns for Carbon County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.4) focuses on survey results obtained for Carbon County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Carbon County. Of these, 71 survey packages were returned as undeliverable, resulting in an adjusted sample size of 282 households. Completed questionnaires were returned from 111 of those households, representing a survey response rate of 39.4%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.5

Summary of Survey Response Patterns for Daggett County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.5) focuses on survey results obtained for Daggett County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 183 residential household mailing addresses in Daggett County. Of these, 110 survey packages were returned as undeliverable, resulting in an adjusted sample size of 73 households. Completed questionnaires were returned from 41 of those households, representing a survey response rate of 56.2%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.6

Summary of Survey Response Patterns for Davis County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.6) focuses on survey results obtained for Davis County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 588 residential household mailing addresses in Davis County. Of these, 91 survey packages were returned as undeliverable, resulting in an adjusted sample size of 497 households. Completed questionnaires were returned from 164 of those households, representing a survey response rate of 33.0%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.7

Summary of Survey Response Patterns for Duchesne County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.7) focuses on survey results obtained for Duchesne County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Duchesne County. Of these, 89 survey packages were returned as undeliverable, resulting in an adjusted sample size of 264 households. Completed questionnaires were returned from 109 of those households, representing a survey response rate of 41.3%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.8

Summary of Survey Response Patterns for Emery County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.8) focuses on survey results obtained for Emery County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 328 residential household mailing addresses in Emery County. Of these, 126 survey packages were returned as undeliverable, resulting in an adjusted sample size of 202 households. Completed questionnaires were returned from 110 of those households, representing a survey response rate of 54.5%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.9

Summary of Survey Response Patterns for Garfield County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.9) focuses on survey results obtained for Garfield County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Garfield County. Of these, 93 survey packages were returned as undeliverable, resulting in an adjusted sample size of 260 households. Completed questionnaires were returned from 126 of those households, representing a survey response rate of 48.5%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.10

Summary of Survey Response Patterns for Grand County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.10) focuses on survey results obtained for Grand County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Grand County. Of these, 47 survey packages were returned as undeliverable, resulting in an adjusted sample size of 306 households. Completed questionnaires were returned from 146 of those households, representing a survey response rate of 47.7%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.11

Summary of Survey Response Patterns for Iron County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.11) focuses on survey results obtained for Iron County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Iron County. Of these, 58 survey packages were returned as undeliverable, resulting in an adjusted sample size of 295 households. Completed questionnaires were returned from 142 of those households, representing a survey response rate of 48.1%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.12

Summary of Survey Response Patterns for Juab County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.12) focuses on survey results obtained for Juab County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Juab County. Of these, 61 survey packages were returned as undeliverable, resulting in an adjusted sample size of 292 households. Completed questionnaires were returned from 135 of those households, representing a survey response rate of 48.6%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.13

Summary of Survey Response Patterns for Kane County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.13) focuses on survey results obtained for Kane County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Kane County. Of these, 84 survey packages were returned as undeliverable, resulting in an adjusted sample size of 269 households. Completed questionnaires were returned from 133 of those households, representing a survey response rate of 49.4%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.14

Summary of Survey Response Patterns for Millard County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.14) focuses on survey results obtained for Millard County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Millard County. Of these, 69 survey packages were returned as undeliverable, resulting in an adjusted sample size of 284 households. Completed questionnaires were returned from 139 of those households, representing a survey response rate of 50.0%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).

Appendix B.15

Summary of Survey Response Patterns for Morgan County

Introduction

The materials included in this appendix are intended to supplement information presented in *Public Lands and Utah Communities: A Statewide Survey of Utah Residents*, a report submitted previously to the Utah Public Lands Coordination Office. That report presented an analysis of results from a 2007 statewide survey of Utah residents conducted by Utah State University that was designed to assess ways in which social and economic conditions across the state may be influenced by public lands and the use and management of natural resources which those lands contain.

The findings presented in the initial summary report were based on comparisons across eleven multi-county geographic clusters located throughout the state, with each cluster comprised of two to four adjoining counties. In response to requests from local government and public agency officials, we have developed a series of supplemental appendices that expand upon the analyses presented in the earlier report and provide an overview of survey response patterns for each of Utah's twenty-nine counties (Appendices B.1 through B.29). In addition, an appendix summarizing overall statewide response patterns (Appendix B.30) was prepared after statistically weighting the responses to correct for variations in county-level sample sizes relative to the population size of each individual county.

This Appendix (B.15) focuses on survey results obtained for Morgan County. As was detailed in the earlier report, self-completion questionnaires were distributed during April through June, 2007 to a random sample of 353 residential household mailing addresses in Morgan County. Of these, 84 survey packages were returned as undeliverable, resulting in an adjusted sample size of 269 households. Completed questionnaires were returned from 142 of those households, representing a survey response rate of 52.8%. Details regarding survey administration procedures and response rates for all 29 counties are available in the project summary report.

The pages that follow contain tables summarizing the ways in which survey participants responded to nearly all of the items included in the survey questionnaire. Tables are presented in the same sequence that questions appeared in the questionnaire, and numbered in a fashion that corresponds to the original question numbers. For example, the table labeled "Q1.3 Recreational activities: backpacking" corresponds to the third item included under question 1 in the survey questionnaire, which asked about respondents' participation in backpacking as a recreational activity on Utah's public lands. Similarly, the table labeled "Q15.4 Public land managers should reduce or increase extent of: exploration or development of oil and gas" corresponds to the fourth item in a series included under question 15 in the survey questionnaire. Table titles and response category labels should allow the reader to interpret the content presented in these tables fairly readily. However, a copy of the survey questionnaire was included as Appendix A in the earlier project summary report, and should be referenced as necessary by readers who wish to understand the specific structure and wording of individual survey questions.

In every table, the responses to individual questions are reported across each of the available response categories in three different ways: as the actual number of respondents who selected a particular response choice (the column labeled "frequency" in each table); as the percent of all survey participants within the county who selected a particular response choice (the column labeled "percent"), and as the percent of survey participants providing a valid answer to the question who selected a particular response choice (the column labeled "valid percent"). Survey participants who did not answer a question had a "NR – non-response" code assigned, and those who wrote in "don't know" had a "DK" code assigned; both of these codes were designated as "missing response" and are not included in the "valid percent" calculations.

At the statewide level, the large number of survey participants (3,799) provides for a high degree of precision in estimating the attitudes, activity patterns, and characteristics of Utah residents based on responses to the survey questionnaire. At the level of individual counties the numbers of survey participants are considerably smaller, in some instances falling well below 100 total responses. Because of this, the results derived from survey response patterns for individual counties must be interpreted with caution, since the potential for random sampling error to produce inaccurate estimates of population characteristics increases substantially when the number of cases in a sample is small. County-based survey results can be considered reasonably precise when the total number of survey respondents is larger than 200. When the number of respondents for a county falls between 100 and 200, results are still likely to be reasonably representative of the overall population, but should be interpreted with some caution. For counties in which the number of survey participants falls below 100 there is considerably more likelihood that the survey findings are not entirely accurate in representing the attitudes, behaviors and characteristics of a county-wide population, and in those instances results need to be interpreted with extreme caution.

Information regarding the overall project, including copies of the multiple project summary reports prepared for various components of the larger study, can be obtained through the Utah Public Lands Policy Coordination Office. Further information regarding the statewide public survey that produced the results presented here and in the earlier statewide summary report titled *Public Lands and Utah Communities: A Statewide Survey of Utah Residents* can be obtained from Dr. Richard Krannich at Utah State University (Richard.Krannich@usu.edu).
